

CE 416
Prestressed Concrete Sessional
(Lab Manual)

Department of Civil Engineering Ahsanullah University of Science and Technology

## Preface

The idea of prestressed concrete has been developed around the latter decades of the 19th century, but its use was limited by the quality of the materials at that time. It took until the 1920s and '30s for its materials development to progress to a level where prestressed concrete could be used with confidence. Currently many bridges and skyscrapers are designed as prestressed structures. This manual intends to provide a general overview about the design procedure of a two way post tensioned slab and a girder. To provide a complete idea, the stress computation, the reinforcement detailing, shear design, the jacking procedure etc. are discussed in details.

This Lab manual was prepared with the help of the renowned text book "Design of Prestressed Concrete Structures", 3rd Edition by T.Y. Lin and Ned H. Burns. The design steps for a two-way post-tensioned slab was prepared according to the simple hand calculation provided by PCA (Portland Cement Association), ACI 318-05 and BNBC 2020 code requirements. The design steps for a post-tensioned composite bridge girder were prepared with the help of several sample design calculations demonstrated in different PC structure design books and seminar papers. It has been done in accordance with AASHTO LRFD Bridge Design Specifications.

## 1. INTRODUCTION

Prestressed concrete is a method for overcoming concrete's natural weakness in tension. It can be used to produce beams, floors or bridges with a longer span than is practical with ordinary reinforced concrete. Prestressing tendons (generally of high tensile steel cable or rods) are used to provide a clamping load which produces a compressive stress that balances the tensile stress that the concrete compression member would otherwise experience due to a bending load. Traditional reinforced concrete is based on the use of steel reinforcement bars, rebars, inside poured concrete.

Prestressing can be accomplished in three ways:

- Pre-tensioned concrete,
- Bonded or
- Unbonded post-tensioned concrete.

## Pre-tensioned concrete

Pre-tensioned concrete is cast around already tensioned tendons. This method produces a good bond between the tendon and concrete, which both protects the tendon from corrosion and allows for direct transfer of tension. The cured concrete adheres and bonds to the bars and when the tension is released it is transferred to the concrete as compression by static friction. However, it requires stout anchoring points between which the tendon is to be stretched and the tendons are usually in a straight line. Thus, most pre-tensioned concrete elements are prefabricated in a factory and must be transported to the construction site, which limits their size. Pre-tensioned elements may be balcony elements, lintels, floor slabs, beams or foundation piles.

## Bonded post-tensioned concrete

Bonded post-tensioned concrete is the descriptive term for a method of applying compression after pouring concrete and the curing process (in situ). The concrete is cast around a plastic, steel or aluminium curved duct, to follow the area where otherwise tension would occur in the concrete element. A set of tendons are fished through the duct and the concrete is poured. Once the concrete has hardened, the tendons are tensioned by hydraulic jacks that react against the concrete member itself. When the tendons have stretched sufficiently, according to the design specifications (see Hooke's law), they are wedged in position and maintain tension after the jacks are removed, transferring pressure to the concrete. The duct is then grouted to protect the tendons from corrosion. This method is commonly used to create monolithic slabs for house construction in locations where expansive soils (such as adobe clay) create problems for the typical perimeter foundation. All stresses from seasonal expansion and contraction of the underlying soil are taken into the entire tensioned slab, which supports the building without significant flexure. Post-
tensioning is also used in the construction of various bridges, both after concrete is cured after support by falsework and by the assembly of prefabricated sections, as in the
segmental bridge. The advantages of this system over un-bonded post-tensioning are:

1. Large reduction in traditional reinforcement requirements as tendons cannot distress in accidents.
2. Tendons can be easily 'weaved' allowing a more efficient design approach.
3. Higher ultimate strength due to bond generated between the strand and concrete.
4. No long term issues with maintaining the integrity of the anchor/dead end.

## Un-bonded post-tensioned concrete

Un-bonded post-tensioned concrete differs from bonded post-tensioning by providing each individual cable permanent freedom of movement relative to the concrete. To achieve this, each individual tendon is coated with a grease (generally lithium based) and covered by a plastic sheathing formed in an extrusion process. The transfer of tension to the concrete is achieved by the steel cable acting against steel anchors embedded in the perimeter of the slab. The main disadvantage over bonded posttensioning is the fact that a cable can distress itself and burst out of the slab if damaged (such as during repair on the slab). The advantages of this system over bonded posttensioning are:

1. The ability to individually adjust cables based on poor field conditions (For example: shifting a group of 4 cables around an opening by placing 2 to either side).
2. The procedure of post-stress grouting is eliminated.
3. The ability to de-stress the tendons before attempting repair work.

## Applications:

- Prestressed concrete is the predominating material for floors in high-rise buildings and the entire containment vessels of nuclear reactors.
- Un-bonded post-tensioning tendons are commonly used in parking garages as barrier cable. Also, due to its ability to be stressed and then de- stressed, it can be used to temporarily repair a damaged building by holding up a damaged wall or floor until permanent repairs can be made.
- The advantages of prestressed concrete include crack control and lower construction costs; thinner slabs - especially important in high rise buildings in which floor thickness savings can translate into additional floors for the same (or lower) cost and fewer joints, since the distance that can be spanned by post-
tensioned slabs exceeds that of reinforced constructions with the same thickness. Increasing span lengths increases the usable unencumbered floorspace in buildings; diminishing the number of joints leads to lower maintenance costs over the design life of a building, since joints are the major focus of weakness in concrete buildings.
- The first prestressed concrete bridge in North America was the Walnut Lane Memorial Bridge in Philadelphia, Pennsylvania. It was completed and opened to traffic in 1951. Prestressing can also be accomplished on circular concrete pipes used for water transmission. High tensile strength steel wire is helicallywrapped around the outside of the pipe under controlled tension and spacing which induces a circumferential compressive stress in the core concrete. This enables the pipe to handle high internal pressures and the effects of external earth and traffic loads.

## Design Example of a Post-Tensioned Composite Bridge Girder

## General

This chapter demonstrates the detailed analysis \& design of a 40 m simple span Pre-stressed PostTensioned I/Bulb Tee Girder. An exterior girder of a double lane bridge having total width of 9.8 m and carriage width of 7.3 m is considered as per our national standard of double lane highway. The design follows AASHTO LRFD Bridge Design Specifications 2012.
(All dimensions are in mm unless otherwise stated)

## Concrete Volume in PC girder

Figure 5: Elevation of PC Girder

Area of Mid-Block
Area of End Block
Area of Slopped Block
Total Volume of Girder

$$
\begin{array}{ll}
= & 0.8466 \mathrm{~m}^{2} \\
= & 1.47 \mathrm{~m}^{2}[\text { calculation not shown }] \\
= & 1.158 \mathrm{~m}^{2}[\text { Avg of Mid\& End Block Area }] \\
= & 2.4 \times 2 \times 1.47+1.2 \times 2 \times 1.158+32.8 \times 0.8466 \mathrm{~m}^{3} \\
= & 37.6 \mathrm{~m}^{3}
\end{array}
$$

## Moment \& Shear Calculation

Calculation of Dead Load Moment
a) Dead Load Moment due to Girder

Load from Mid-Block $=0.8466 \times 24=20.32 \mathrm{KN} / \mathrm{m}$
Load from End Block $=1.47 \times 24=35.28 \mathrm{KN} / \mathrm{m}$

Figure 6: Self Weight of Girder

Reaction at Support $=35.28 \times 2.4+\frac{35.28+20.32}{2} \times 1.2+20.32 \times \frac{32.8}{2}=451.3 \mathrm{KN}$

Moment at Mid Span, $\mathrm{M}_{\mathrm{L} / 2}=451.3 \times 19.55-35.28 \times 2.4 \times 18.8-\frac{1.2 \times(35.28-20.32)}{2} \times 17.2-$ $20.32 \times$ $17.6 \times \frac{17.6}{2}$ $=3929.5 \mathrm{KN} . \mathrm{m}$

## b) Dead Load Moment due to Cross Girder

Load from Exterior $=1.1 \times(1-0.1375) \times 0.5 \times 24=11.4 \mathrm{KN}$
Load from Interior $=1.1 \times(1-0.1375) \times 0.3 \times 24=6.83 \mathrm{KN}$

Figure 7: Load due to Cross Girder

Reaction at Support $=\frac{(2 \times 11.4+3 \times 6.83)}{2}=21.645 \mathrm{KN}$
Moment at Mid Span, $\mathrm{M}_{\mathrm{L} / 2}=21.645 \times 19.55-11.4 \times 19.55-6.83 \times 10=132 \mathrm{KN} . \mathrm{m}$
c) Dead Load Moment due to Deck Slab

Load from Deck, w $\quad=\quad 1.9 \times 0.2 \times 24=9.12 \mathrm{KN} / \mathrm{m}$

Figure 8: Self Weight of Deck Slab
Moment at Mid Span, $\mathrm{M}_{\mathrm{L} / 2}$ $=\quad \mathrm{wL}^{2} / 8=\left(9.12 \times 39.1^{2}\right) / 8=1743 \mathrm{KN}-\mathrm{m}$

## d) Dead Load Moment due to Other Loads

Load from Rail Bar $=1.08 \mathrm{KN} / \mathrm{m} \quad$ [explanation needed]
Load from Rail Post $=0.672 \mathrm{KN} / \mathrm{m}$ [explanation needed]

| Load from Wheel Guard, Post Base etc | $=$ | $1.35 \mathrm{KN} / \mathrm{m} \quad$ [explanation needed] |
| :--- | :--- | :--- |
| Load from Footpath, Walkway Slab etc | $=$ | $4.0 \mathrm{KN} / \mathrm{m} \quad$ [explanation needed] |
| Load from Wearing Course | $=$ | $0.748 \mathrm{KN} / \mathrm{m}[0.650 \times 0.05 \times 23]$ |
| Sub Total | $=7.85 \mathrm{KN} / \mathrm{m}$ |  |

### 7.85 KN/m

Figure 9: Other (Rail Bar, Rail Post, Wheel Guard, Post Base, Footpath, Walkway Slab and Wearing Course) Loads

Moment at Mid, $\mathrm{M}_{\mathrm{L} / 2}=\mathrm{wL}^{2} / 8=\left(7.85 \times 39.1^{2}\right) / 8=1500.1 \mathrm{KN}-\mathrm{m}$
e) Total Dead Load Moment

$$
\begin{aligned}
\mathrm{M}_{\mathrm{DL}} & =\text { Girder }+ \text { Cross Girder }+ \text { Deck Slab }+ \text { Other } \\
& =3929.5+132+1743+1500.1 \\
& =7304.6 \mathrm{KN}-\mathrm{m}
\end{aligned}
$$

f) Total Factored Dead Load Moment

$$
\begin{aligned}
\mathrm{MF}_{\mathrm{DL}}= & (3929.5+132+1743) \times 1.25+1500.1 \times 1.5 \\
& {\left[\text { AASTHO }{ }^{\circ} 12, \text { Table } 3.4 .1-2\right] } \\
= & 9505.8 \mathrm{KN}-\mathrm{m}
\end{aligned}
$$

## Calculation of Live Load Moment

According to AASTHO LRFD HL 93 loading, each design lane should occupy either by the design truck or design tandem and lane load which will be effective 3000 mm transversely within a design lane. [AASTHO `12 3.6.1.2.1]

## Distribution Factor for Moment <br> For Interior Beam/ Girder

| One Design Lane Loaded: | $1100 \leq S \leq 4900$ |
| :---: | :---: |
| $0.06+\left(\frac{S}{4300}\right)^{0.4}\left(\frac{S}{L}\right)^{0.3}\left(\frac{K_{g}}{L t_{s}^{3}}\right)^{0.1}$ | $6000 \leq L \leq 73000$ |
| $N_{b} \geq 4$ |  |
| Two or More Design Lanes Loaded: | $4 \times 10^{9} \leq K_{g} \leq 3 \times 10^{12}$ |
| $0.075+\left(\frac{S}{2900}\right)^{0.6}\left(\frac{S}{L}\right)^{0.2}\left(\frac{K_{g}}{L t_{s}^{3}}\right)^{0.1}$ |  |
| use lesser of the values obtained from the <br> equation above with $N_{b}=3$ or the lever rule | $N_{b}=3$ |

[AASTHO `12, Table 4.6.2.2.2b-1]
Here,
S = Spacing of Main Girder
$\mathrm{t}_{\mathrm{s}}=$ Thickness of Slab
L = Span Length
$\mathrm{N}_{\mathrm{b}}=$ Number of Beam/ Girder
$K_{g}=n\left(I+A_{g}{ }^{2}\right)$
$\mathrm{n}=\mathrm{E}_{\mathrm{B}} / \mathrm{E}_{\mathrm{D}}$
$\mathrm{E}_{\mathrm{B}}=$ Modulus of elasticity of beam/ girder material (MPa)
$\mathrm{E}_{\mathrm{D}}=$ Modulus of elasticity of deck/ slab material (MPa)
$\mathrm{I}=$ Moment of inertia of beam/ girder $\left(\mathrm{mm}^{4}\right)$
A=Area of Girder ( $\mathrm{mm}^{2}$ )
$\mathrm{e}_{\mathrm{g}}=$ distance between center of gravity of beam/ girder and deck/ slab (mm)

$$
\begin{aligned}
\mathrm{K}_{\mathrm{g}} & =\frac{\sqrt{40}}{\sqrt{30}}\left\{2.654 \times 10^{11}+846562.5 \times(1800-763.75)^{2}\right\} \\
& =1.356 \times 10^{12}
\end{aligned}
$$

Distribution Factor for Moment, DFM $=0.075+\left(\frac{S}{2900}\right)^{0.6}\left(\frac{S}{L}\right)^{0.2}\left(\frac{k_{g}}{L \times t_{s}{ }^{3}}\right)^{0.1}$

$$
\begin{aligned}
& =0.075+\left(\frac{2000}{2900}\right)^{0.6}\left(\frac{2000}{40000}\right)^{0.2}\left(\frac{1.356 \times 10^{12}}{40000 \times 200^{3}}\right)^{0.1} \\
& =0.583
\end{aligned}
$$

## For Exterior Beam/ Girder

| One Design <br> Lane Loaded | Two or More Design <br> Lanes Loaded | Range of <br> Applicability |
| :---: | :---: | :---: |
| Lever Rule | $g=e g_{\text {interior }}$ <br> $e=0.77+\frac{d_{e}}{2800}$ | $-300 \leq d_{e} \leq 1700$ |
|  | use lesser of the values <br> obtained from the <br> equation above with $N_{b}$ <br> 3 or the lever rule | $N_{b}=3$ |

[AASTHO `12, Table 4.6.2.2.2d-1]

Here,

$$
g=\text { distribution factor for exterior beam/girder }
$$

$g_{\text {interior }}=$ distribution factor for interior beam/ girder
$\mathrm{e}=$ eccentricity of a lane from center of gravity of the pattern of girders (mm)
$d_{e}=$ distance from the exterior web of exterior beam to the interior edge of curb or
traffic barrier (mm).

$$
e=0.77+\frac{d_{e}}{2800}=0.77+\frac{4000-\frac{7300}{2}}{2800}=0.895 \mathrm{~mm}
$$

Distribution Factor for Moment, DFM, $g=\mathrm{ex}_{\text {interior }}=0.895 \times 0.583=0.523$

## a) Moment due to Truck Load

[AASTHO `12, Figure 3.6.1.2.2-1]

Figure 10: AASTHO HL-93 Truck Loading

Rear Axle Load $=145 \times D F M=145 x 0.523=75.84 \mathrm{KN}$
Front Axle Load $=35 \times D F M=35 \times 0.523=18.31 \mathrm{KN}$

Figure 11: AASTHO HL-93 Truck Loading

$$
\text { CG of Load }=\frac{75.84 \times 0+75.84 \times 4.3+18.31 \times 8.6}{75.84 \times 2+18.31}=2.845 \mathrm{~m}
$$

$$
\begin{aligned}
\text { Reaction at Left Support } & =\frac{75.84 \times 23.123+75.84 \times 18.823+18.31 \times 14.523}{39.1} \\
& =88.16 \mathrm{KN}
\end{aligned}
$$

Moment at Mid, $\mathrm{M}_{\mathrm{L} / 2}=88.16 \times 19.55-75.84 \times(4.3-0.727)=1452.55 \mathrm{KN}-\mathrm{m}$
Impact Moment $=1452.55 \times 0.33=479.3 \mathrm{KN}-\mathrm{m}$ [AASTHO `12, Table 3.6.2.1-1] Total Live Load Moment due to Truck Load \(=1452.55+479.3=1931.85 \mathrm{KN}-\mathrm{m}\) (Governs) b) Moment Due to Tandem Load [AASTHO`12, 3.6.1.2.3]

Wheel Load

$$
\begin{gathered}
=110 \times 0.523=57.53 \mathrm{KN} \\
57.53 \mathrm{KN} \quad 57.53 \mathrm{KN}
\end{gathered}
$$

Figure 12: AASTHO Standard Tandem Loading
Moment at Mid, $\mathrm{M}_{\mathrm{L} / 2}=57.53 \times 19.55-57.53 \times 0.6=1090.2 \mathrm{KN}-\mathrm{m}$
Impact Moment $\quad=1090.2 \times 0.33=359.8 \mathrm{KN}-\mathrm{m}$
Total Live Load Moment due to Tandem Load $=1090.2+359.8=1450 \mathrm{KN}-\mathrm{m}$ (Does not govern)
c) Moment Due to Lane Load

Lane Load, $\mathrm{w} \quad=9.3 \mathrm{xDFM}=9.3 \mathrm{x} .523=4.864 \mathrm{KN} / \mathrm{m}$

Figure 13: Lane Load
Moment at Mid, $\mathrm{M}_{\mathrm{L} / 2}=\mathrm{wL}^{2} / 8=\left(4.864 \times 39.1^{2}\right) / 8=929.5 \mathrm{KN}-\mathrm{m}$

## d) Total Live Load Moment

As Truck Load Moment is higher than Tandem Load Moment, the total vehicular live load moment as stated in AASTHO,

$$
\begin{aligned}
\mathrm{M}_{\mathrm{LL}} & =\text { Truck Load }+ \text { Lane Load } \\
& =1931.85+929.5=2861.35 \mathrm{KN}-\mathrm{m}
\end{aligned}
$$

e) Factored Total Live Load Moment

$$
\mathrm{M}_{\mathrm{FLL}}=2861.35 \times 1.75=5007.36 \mathrm{KN}-\mathrm{m} \text { [AASTHO } ` 12 \text {, Table 3.4.1-1] }
$$

## Shear Calculation

## a) Shear due to Dead Load

Shear due to Self-Weight of Girder $=451.3 \mathrm{KN}$
Shear due to Cross Girder $\quad=21.645 \mathrm{KN}$
Shear due to Deck Slab
$=9.12 \mathrm{x}(39.1 / 2) \mathrm{KN}=178.3 \mathrm{KN}$
Shear due to Other Loads
$=7.85 \mathrm{x}(39.1 / 2) \mathrm{KN}=153.47 \mathrm{KN}$
Total Dead Load Shear
$=(451.3+21.645+178.3+153.47) \mathrm{KN}$
$=804.72 \mathrm{KN}$
b) Distribution Factor for Shear [AASTHO `12, Table 4.6.2.2.3a-1]

## For Interior Beam/ Girder

| $0.36+\frac{S}{7600}$ | $0.2+\frac{S}{3600}-\left(\frac{S}{10700}\right)^{2.0}$ | $\begin{aligned} & 1100 \leq S \leq 4900 \\ & 6000 \leq L \leq 73000 \\ & 110 \leq t_{s} \leq 300 \\ & N_{b} \geq 4 \end{aligned}$ |
| :---: | :---: | :---: |
| Lever Rule | Lever Rule | $N_{b}=3$ |

[AASTHO `12, Table 4.6.2.2.3a-1]
Distribution Factor for Shear, DFV $=0.2+\frac{2000}{3600}-\left(\frac{2000}{10700}\right)^{2}=0.721$

## For Exterior Beam/ Girder

| One Design <br> Lane Loaded | Two or More Design <br> Lanes Loaded | Range of <br> Applicability |
| :---: | :---: | :---: |
| Lever Rule | $g=e g_{\text {interior }}$ <br> $e=0.6+\frac{d_{e}}{3000}$ | $-300 \leq d_{e} \leq 1700$ |
|  | Lever Rule | $N_{b}=3$ |
|  |  |  |
|  |  |  |

[AASTHO `12, Table 4.6.2.2.3b-1]

$$
e=0.6+\frac{d_{e}}{3000}=0.6+\frac{4000-\frac{7300}{2}}{3000}=0.717
$$

Distribution Factor for Shear, $D F V, g=e \times g_{\text {interior }}=0.717 \times 0.721=0.517$

## c) Shear due to Live Load

## i. Shear due to Truck Load

Rear Axle Load $=145 \times \mathrm{DFV}=145 \times 0.517=75 \mathrm{KN}$
Front Axle Load $=35 \times$ DFV $=35 \times 0.517=18.1 \mathrm{KN}$

Figure 14: AASTHO HL-93 Truck Loading

Reaction at Left Support $=\frac{75 \times 39.1+75 \times 34.8+18.1 \times 30.5}{39.1}=155.87 \mathrm{KN}$
Impact Shear $=(155.87 x 0.33)=51.44 \mathrm{KN}$
Total Shear due to Truck $=(155.87+51.44) \mathrm{KN}=207.31 \mathrm{KN}($ Governs $)$

## ii. Shear due to Tandem Load

Wheel Load

$$
=110 \times 0.517=56.87 \mathrm{KN}
$$

Figure 15: AASTHO Standard Tandem Loading
Reaction at Left Support $=\frac{56.87 \times 39.1+56.87 \times 37.9}{39.1}=112 \mathrm{KN}$
Impact Shear $=(112 x 0.33)=36.96 \mathrm{KN}$
Total Shear due to Tandem $=(112+36.96) \mathrm{KN}=148.96 \mathrm{KN}$
(Does not govern)

## iii. Shear due to Lane Load

Load due to lane per unit Length $\quad=9.3 \times 0.517 \mathrm{KN} / \mathrm{m}=4.81 \mathrm{KN} / \mathrm{m}$
Shear Due to Lane Load
Total Live Load Shear

$$
=(4.81 \times 39.1) / 2 \mathrm{KN}=94.04 \mathrm{KN}
$$

$$
=(207.31+94.04) \mathrm{KN}=301.35 \mathrm{KN}
$$

d) Total Shear

$$
V_{D+L}=804.72+301.35=1106.07 \mathrm{KN}
$$

## e) Total Factored Shear

$$
\mathrm{V}_{\mathrm{F}(\mathrm{D}+\mathrm{L})}=(804.72 \times 1.5+301.35 \times 1.75)=1734.44 \mathrm{KN}[\mathrm{Ref}]
$$

## Estimation of Required Pre-Stressed Force and Number of Cable

Assumed Number of Cable $=3$
CG of the Cable at Girder Mid $=\frac{2660 \times 3 \times 135}{2660 \times 3}=135 \mathrm{~mm}=0.135 \mathrm{~m}$
Eccentricity at Mid-Section $=(0.764-0.135) \mathrm{m}=0.629 \mathrm{~m}$
Required Prestress Force, $F=\frac{M_{p}+M_{C} \times m_{b}-f^{\prime}{ }_{b} \times k_{t} \times A_{c}}{e+k_{t}}$
For full pre-stressing, $\mathrm{f}^{\prime}{ }_{\mathrm{b}}=0$
[Design of Prestressed Concrete Structures, T.Y. Lin, Chapter 6, Equation 6-18]
Here,
$\mathrm{M}_{\mathrm{P}}=$ Moment due to Girder, Cross Girder \& Deck Slab [Precast]
$M_{C}=$ Moment due to Live Load \& Wearing Course [Composite, Service Condition]

$$
\begin{aligned}
& =\frac{(3929.5+132+1743)+(2810.1+143) \times 0.751}{0.629+0.41} \\
& =7721.2 \mathrm{KN}
\end{aligned}
$$

Required Steel Area, $A_{s} \quad=\frac{7721.2 \times 1000}{0.6 * 1860}=6918.6 \mathrm{~mm}^{2}$
Using 19K15 Strand, Required Cable $=\left(\frac{6918.6}{2660}\right)$
$=2.6$ Nos.
Here, Pre-stressing is done in single stage

| Jacking Force | $=3710 \times 3=11130 \mathrm{KN}$ |
| :--- | :--- |
| Eccentricity of Girder Section | $=(0.764-0.135) \mathrm{m}=0.629 \mathrm{~m}$ |
| Eccentricity of Composite Section | $=(1.0265-0.135) \mathrm{m}=0.8915 \mathrm{~m}$ |

Figure 16: Cable arrangement in Mid and End Section of Girder

|  |  |  |  | Percent Loss $=$ |  | 3.54(Average) |

Friction Loss [Sample Calculation of Cable 1]
Friction Loss, $\Delta \mathrm{f}_{\mathrm{pF}}=\Delta \mathrm{f}_{\mathrm{pi}}\left[1-\mathrm{e}^{-(\mathrm{kx}+\mu \alpha)}\right]\left[\right.$ AASTHO ${ }^{`} 12$, Equation 5.9.5.2.2b-1]
Here,
Friction Co-Efficient, $\mu=0.25$
[AASTHO `12, Table 5.9.5.2.2b-1]
Wobble Co-Efficient, $\mathrm{k}=0.00066 / \mathrm{m}$
$\alpha=\sqrt{\alpha_{\mathrm{v}}{ }^{2}+\alpha_{\mathrm{H}}{ }^{2}} \quad \alpha=\frac{\mathrm{X}}{\mathrm{R}}$
Radius of Curvature, $\mathrm{R}=\frac{\mathrm{L}^{2}}{8 \times \mathrm{d}_{\mathrm{r}}}=\frac{39.1^{2}}{8 \times 0.165}=1158.2 \mathrm{rad}$
$\mathrm{d}_{\mathrm{r}}=$ vertical sag height $=300-135=165 \mathrm{~mm}=0.165 \mathrm{~m}$
$\alpha=\frac{X}{R}=\frac{1}{1158.2}=8.63 \times 10^{-4} ; \quad X=1 \mathrm{~m}$
$\alpha=\frac{X}{R}=\frac{19.55}{1158.2}=0.0169 ; \quad X=\frac{L}{2}=19.55 \mathrm{~m}$

$$
\text { Friction Loss, } \Delta \mathrm{f}_{\mathrm{pF}}=3710\left[1-\mathrm{e}^{-\left(0.00066 \times 1+0.25 \times 8.63 \times 10^{-4}\right)}\right]=2.61 \mathrm{KN} ; \mathrm{X}=1 \mathrm{~m}
$$

$$
\text { Friction Loss, } \Delta \mathrm{f}_{\mathrm{pF}}=3710\left[1-\mathrm{e}^{-(0.00066 \times 19.55+0.25 \times 0.0169)}\right]=63 \mathrm{KN} ; \mathrm{X}=19.55 \mathrm{~m}
$$

## Anchorage Slip Loss [Calculation of Cable 1]

Let's Assume, Anchorage Slip $=6 \mathrm{~mm}$
[AASHTO ` 12 , C5.9.5.2.1]
Distance till which anchorage slip loss will be effective,
$\mathrm{X}_{\mathrm{A}}=\sqrt{\frac{\operatorname{Slip} \times \mathrm{E}_{\mathrm{p}} \times \mathrm{A}_{\mathrm{s}}}{\Delta \mathrm{f}_{\mathrm{pF}}}}=\sqrt{\frac{0.006 \times 197 \times 2660}{2.61}}=34.71 \mathrm{~m}$

Anchorage Slip loss will only occur when $\mathrm{X}_{\mathrm{A}}>\frac{\mathrm{L}}{2}$
Loss due to slip $=2 \times \Delta \mathrm{f}_{\mathrm{pF}} \times\left(\mathrm{X}_{\mathrm{A}}-\frac{\mathrm{L}}{2}\right)=2 \times 2.61 \times(34.71-19.55)=79.14 \mathrm{KN}$
Friction and Slip Loss $=63+79.14=142.14 \mathrm{KN}$

$$
\text { Percentage }(\%)=\frac{142.14}{3710} \times 100=3.83 \%
$$

## b) Elastic Shortening Loss

$\Delta \mathrm{f}_{\text {PES }}=\frac{\mathrm{N}-1}{2 \mathrm{~N}} \frac{\mathrm{E}_{\mathrm{p}}}{\mathrm{E}_{\mathrm{ci}}} \mathrm{f}_{\mathrm{cgp}}$
Here,
$\mathrm{N}=$ Number of identical pre-stressing tendons;
$\mathrm{f}_{\mathrm{cgp}}=$ Sum of concrete stresses at the center of gravity of pre-stressing tendons due to the pre-stressing force after jacking and the self-weight of the member at the sections of the maximum moments (MPa)
$f_{c g p}=\frac{P_{\text {eff }}}{A}+\frac{P_{\text {eff }} \times e^{2}}{I}-\frac{M_{g} \times e}{I}$

$$
=\frac{3579 \times 3}{0.8466}+\frac{3579 \times 3 \times 0.629^{2}}{0.2654}-\frac{3929.5 \times 0.629}{0.2654}=19375.6 \frac{\mathrm{KN}}{\mathrm{~m}^{2}}=19.376 \mathrm{MPa}
$$

$[3710 \mathrm{KN} \mathrm{x}(100 \%-3.54 \%)=3579 \mathrm{KN}]$
$\Delta \mathrm{f}_{\text {PES }}=\frac{3-1}{2 \times 3} \times \frac{197 \times 10^{3}}{30335} \times 19.376=41.94 \mathrm{MPa}$

Percent of Elastic Shortening Loss $=\frac{41.94 \times 2660}{3710 \times 1000} \times 100=3 \%$
Total Instantaneous Loss $=3.54+3=6.54 \%$

## Long Term / Time Dependent Loss

Approximate Estimate of Time-Dependent Losses,
[AASTHO` 12, 5.9.5.3-1]
Long Term Loss due to Shrinkage, Creep and Still Relaxation is given below.
$\Delta f_{p L T}=10 \times \frac{f_{p i} \times A_{p s}}{A_{g}} \times \gamma_{h} \gamma_{s t}+83 \gamma_{h} \gamma_{s t}+\Delta f_{p R}$
Where,
$\gamma_{\mathrm{h}}=1.7-0.01 \mathrm{H}, \quad$ Relative Humidity, $\mathrm{H}=70 \%$
$\gamma_{\mathrm{st}}=\frac{35}{7+\mathrm{f}_{\mathrm{ci}}^{\prime}}=\frac{35}{7+36}=0.814$
Here,

$$
\begin{aligned}
& f_{p i}= \begin{array}{l}
\text { prestressing steel stress immediately prior to } \\
\text { transfer (MPa) }
\end{array} \\
& H= \begin{array}{l}
\text { the average annual ambient relative humidity } \\
(\%)
\end{array} \\
& \gamma_{h}= \begin{array}{l}
\text { correction factor for relative humidity of the } \\
\text { ambient air }
\end{array} \\
& \gamma_{s t}= \begin{array}{l}
\text { correction factor for specified concrete strength } \\
\text { at time of prestress transfer to the concrete } \\
\text { member }
\end{array} \\
&=\begin{array}{l}
\text { an estimate of relaxation loss taken as 17 MPa } \\
\text { for low relaxation strand, 70 MPa for stress } \\
\text { relieved strand, and in accordance with } \\
\text { manufacturers recommendation for other types } \\
\text { of strand }(\mathrm{MPa})
\end{array} \\
& \Delta f_{p R}
\end{aligned} \quad \begin{aligned}
& 10 \times 0.75 \times 1860 \times 2660 \\
& \Delta \mathrm{f}_{\mathrm{pLT}}=\left.\frac{10 \times(1.7-0.01 \times 70 \%) \times\left(\frac{35}{7+36}\right)+83}{1.176 \times 10^{6}} \times(1.7-0.01 \times 70 \%) \times\left(\frac{35}{7+36}\right)+17\right]=[25.68+67.56+17]=110.24 \mathrm{MPa}
\end{aligned}
$$

Percent of Time Dependent Loss $=\frac{110.24 \times 2660}{3710 \times 1000} * 100=7.9 \%$
Total Loss $($ Instantaneous \& Time Dependent $)=(6.54+7.9) \%=14.44 \%$

## Revised No of Required Cable

| Total Percent of Loss | $=14.44 \%$ |
| :--- | :--- |
| Total Loss | $=1395 * 14.44 \% \mathrm{MPa}=201.438 \mathrm{Mpa}$ |
| Effective Steel Stress after Loss | $=0.75 * 1860-201.438=1193.562 \mathrm{MPa}$ |

Revised No of Required Cable,

$$
\frac{\text { Requred Effective Force } * 1000}{\mathrm{~A}_{\mathrm{ps}} * \text { Effective Steel Stress after Loss }}=\frac{7721.2 * 1000}{2660 * 1193.562}=2.43 \text { Nos. }
$$

Actual Effective Force per Cable $\quad=1193.562 x(2660 / 1000)=3174.87 \mathrm{KN}$
Actual Effective Stress per Cable $=1193.562 \mathrm{MPa}$

## Stress Calculation

Table 4: Calculation of Stress in different stages

| Calculation of Stress |  |
| :---: | :---: |
| Stress due to Self-Weight of Girder $\begin{gathered} \text { [+ = Compressive } \\ \text { - = Tension }] \end{gathered}$ | $\begin{aligned} & \sigma=\left(\frac{\mathrm{M}_{\mathrm{g}} * \mathrm{Y}}{\mathrm{I}_{\mathrm{g}}}\right) * \frac{1}{1000} \\ & \sigma_{\mathrm{b}}=-\frac{3929.5 * .764}{.2654 * 1000}=-11.31 \mathrm{MPa} \\ & \sigma_{\mathrm{t}}=+\frac{3929 * .837}{.2654 * 1000}=+12.39 \mathrm{MPa} \end{aligned}$ |

## Checking of Moment Capacity

Factored Moment $(\mathrm{DL}+\mathrm{LL})=(13259.07+61429.22)=74688.28 \mathrm{KN}-\mathrm{m}$
$\mathrm{k}=2\left(1.04-\frac{\mathrm{f}_{\mathrm{pu}}}{\mathrm{f}_{\mathrm{py}}}\right)=2(1.04-0.9)=0.28$
$d_{p}=3500+200-503.33=3196 m m$

Let's Assume Rectangular Behavior,
$c=\frac{\left(A_{p s} f_{p u}+A_{s} f_{y}-A_{s}{ }^{\prime} f_{y}{ }^{\prime}\right.}{\left(0.85 f^{\prime}{ }_{c} \beta_{1} b+\frac{k A_{p s} f_{p u}}{\mathrm{~d}_{\mathrm{p}}}\right)}$

$$
=\frac{2660 * 9 * 1860}{\left(0.85 * 40 * 0.76 * 1900+\frac{0.28 * 2660 * 1860 * 9}{3196}\right)}=840>200, T \text { action }
$$

Let's Assume T behavior,

$$
\begin{aligned}
\mathrm{c} & =\frac{\left(\mathrm{A}_{\mathrm{ps}} \mathrm{f}_{\mathrm{pu}}+\mathrm{A}_{\mathrm{s}} \mathrm{f}_{\mathrm{s}}-\mathrm{A}_{\mathrm{s}}^{\prime} \mathrm{f}^{\prime}{ }_{\mathrm{s}}-0.85 \mathrm{f}^{\prime}{ }_{\mathrm{c}}\left(\mathrm{~b}-\mathrm{b}_{\mathrm{w}}\right) \mathrm{h}_{\mathrm{f}}\right.}{\left(0.85 \mathrm{f}^{\prime}{ }_{\mathrm{c}} \beta_{1} \mathrm{~b}_{\mathrm{w}}+\frac{\mathrm{kA}_{\mathrm{ps}} \mathrm{f}_{\mathrm{pu}}}{\mathrm{~d}_{\mathrm{p}}}\right)} \\
& =\frac{2660 * 9 * 1860-0.85 * 45(1900-400) * 200}{\left(0.85 * 40 * 0.76 * 400+\frac{0.28 * 2660 * 1860 * 9}{3196}\right)}=2.32 \mathrm{~m} \\
\alpha & =\beta_{1} * \mathrm{c}=0.76 * 2.35=1.76 \mathrm{~m} \\
\mathrm{f}_{\mathrm{ps}} & =\mathrm{f}_{\mathrm{pu}}\left(1-\frac{\mathrm{k} * \mathrm{c}}{\mathrm{~d}_{\mathrm{p}}}\right)=1860\left(1-\frac{0.28 * 2.32}{3.196}\right)=1480 \mathrm{MPa}
\end{aligned}
$$

$M_{n}=A_{p s} f_{p s}\left(d_{p}-\frac{a}{2}\right)+A_{s} f_{s}\left(d_{s}-\frac{a}{2}\right)+A_{s}{ }^{\prime} f_{y}{ }^{\prime}\left(d^{\prime}{ }_{s}-\frac{a}{2}\right)+0.85 f^{\prime}{ }_{c}\left(b-b_{w}\right) h_{f}\left(\frac{a}{2}-\frac{h_{f}}{2}\right)$
$M_{\mathrm{n}}=2660 * 9 * 1480 *\left(3196-\frac{1760}{2}\right)+0.85 * 40 *(1900-400) * 200 *\left(\frac{1760}{2}-\frac{200}{2}\right)$
$=90015 \mathrm{KN}-\mathrm{m}$
$\mathrm{M}_{\mathrm{r}}=\varnothing * \mathrm{M}_{\mathrm{n}}=0.9 * 90015=81015 \mathrm{KN}-\mathrm{m}$
$M_{u}=74688 \mathrm{KN}-\mathrm{m}$

$$
M_{r}>M_{u}(\mathrm{ok})
$$

## Deflection Calculation

CG of cable (7 Nos.) at PS-I $\quad=610 \mathrm{~mm}$
CG of cable (2 Nos.) at PS-II $\quad=130 \mathrm{~mm}$
CG of Cable at Girder End at PS-I $=1925 \mathrm{~mm}$
CG of Cable at Girder End at PS-II $=225 \mathrm{~mm}$

## a) Deflection due to self-weight of girder

Self - weight $\mathrm{w}=\frac{\text { volumn } * \text { unit weight }}{\text { span }}=\frac{150.2675 \times 24}{73}=49.40 \mathrm{KN} / \mathrm{m}$
Deflection $=\frac{5 \mathrm{wL}^{4}}{384 \times \text { Eci x Ic }}=\frac{5 \times 49.40 \times 73^{4}}{384 \times 26290 \times 2.59}=268 \mathrm{~mm}$

## b) Deflection due to PS-I

CG of Cable at Girder End $=1925 \mathrm{~mm}$
Sag Height $=(1925-610) \mathrm{mm}=1315 \mathrm{~mm}$
Eccentricity of End Section $=(1797-1925) \mathrm{mm}=-118 \mathrm{~mm}$
Average Prestressed Force after IL $=3710 \times 7\left(1-\frac{5.23}{100}-\frac{3.71}{100}\right)=23648 \mathrm{KN}$

Equivalent upward UDL due to Cable Parabola $=\frac{8 \times \mathrm{p} \mathrm{x} \mathrm{sag}}{\mathrm{L}^{2}}=\frac{8 \times 23648 \times 1.315}{73^{2}}$

$$
=46.68 \mathrm{KN} / \mathrm{m}
$$

Upward deflection due to PS-I transfer,
$\frac{5 \mathrm{wL}^{4}}{384 \times \text { Eci x I }}=\frac{5 \times 46.68 \times 73^{4}}{384 \times 26290 \times 2.59}=253.5 \mathrm{~mm}$
Deflection at Girder End eccentricity,
$\frac{\mathrm{pxe} \mathrm{end} \mathrm{L}^{2}}{8 \times \text { Eci x I }}=\frac{23648 \times(-0.118) \times 73^{2}}{8 \times 26290 \times 2.59}=-27.3 \mathrm{~mm}$

## c) Deflection due to PS-II

CG of Cable in PS-II at girder end $=225 \mathrm{~mm}$
Sag Height $=(225-130)=95 \mathrm{~mm}$
Eccentricity at PS-II cable at girder end $=(1.797-0.225)=1.572 \mathrm{~m}$

$$
\text { Average Prestressed Force after } \mathrm{IL}=3710 \times 2\left(1-\frac{5.23}{100}-\frac{3.71}{100}\right)=6756.7 \mathrm{KN}
$$

Equivalent upward UDL due to Cable Parabola $=\frac{8 \times \mathrm{p} \mathrm{x} \mathrm{sag}}{\mathrm{L}^{2}}=\frac{8 \times 6756.7 \times 0.095}{73^{2}}$

$$
=0.96 \mathrm{KN} / \mathrm{m}
$$

Upward deflection due to PS-II transfer,
$\frac{5 \mathrm{wL}^{4}}{384 \times \text { Eci x I }}=\frac{5 \times 0.96 \times 73^{4}}{384 \times 30358 \times 2.59}=4.5 \mathrm{~mm}$
Deflection at Girder End eccentricity,
$\frac{\mathrm{pre}_{\text {end } \mathrm{L}^{2}}}{8 \times \text { Eci } \times \mathrm{I}}=\frac{6756.7 \times 1.572 \times 73^{2}}{8 \times 30358 \times 2.59}=90.3 \mathrm{~mm}$
d) Net Deflection $=($ Net Hogging - Net Sagging $)$

$$
\begin{aligned}
& =\left[D_{\text {PS-I }}+D_{\text {EPS-I }}+D_{\text {PS-II }}+D_{\text {EPS-II }}-D_{W}\right] \\
& =[253.5-27.3+4.5+90.3-268] \\
& =53 \mathrm{~mm}
\end{aligned}
$$

## 3. DESIGN EXAMPLE OF A TWO-WAY POST-TENSIONED SLAB

The following example illustrates the design methods presented in ACI 318-05, IBC 2003 and BNBC 2020. Unless otherwise noted, all referenced table, figure, and equation numbers are from these books. The example presented here is for Two-Way Post-Tensioned Design.

Figure 1: Typical Plan of a Slab

## Loads:

Framing Dead Load $=$ self-weight
Superimposed Dead Load $=25$ psf [partitions and misc.]
Live Load $=40$ psf
residential 2 hour fire-rating

## Materials:

## Concrete:

Normal weight 150 pcf
$\mathrm{f}_{\mathrm{c}}{ }^{\prime}=5,000 \mathrm{psi}$
$\mathrm{f}_{\mathrm{ci}}=3,000 \mathrm{psi}$

## Rebar:

$\mathrm{f}_{\mathrm{y}}=60,000 \mathrm{psi}$
PT: Unbonded tendons $1 / 2 " \phi, 7$-wire strands, $\mathrm{A}=0.153$ in $^{2}$
$\mathrm{f}_{\mathrm{pu}}=270 \mathrm{ksi}$
Estimated prestress losses $=15 \mathrm{ksi}($ ACI 18.6 $)$
$\mathrm{f}_{\mathrm{se}}=0.7(270 \mathrm{ksi})-15 \mathrm{ksi}=174 \mathrm{ksi}(\mathrm{ACI} 18.5 .1)$
$\mathrm{P}_{\text {eff }}=\mathrm{A} * \mathrm{fse}=(0.153)(174 \mathrm{ksi})=26.6 \mathrm{kips} /$ tendon

## Determine Preliminary

## Slab Thickness

Start with L/h $=45$
Longest span $=30 \mathrm{ft} \mathrm{h}=(30 \mathrm{ft})(12) / 45=8.0$ " preliminary slab thickness

## Loading

$$
\begin{aligned}
& \mathrm{DL}=\text { Selfweight }=(8 \mathrm{in})(150 \mathrm{pcf})=100 \mathrm{psf} \\
& \text { SIDL }=25 \mathrm{psf} \\
& \text { LLo }=40 \mathrm{psf}
\end{aligned}
$$

## Design of East-West Interior Frame

Use Equivalent Frame Method, ACI 13.7 (excluding sections 13.7.7.4-5)
Total bay width between centerlines $=25 \mathrm{ft}$
Ignore column stiffness in equations for simplicity of hand calculations
No pattern loading required, since LL/DL < 3/4 (ACI 13.7.6)

## Calculate Section Properties

Two-way slab must be designed as Class U (ACI 18.3.3),
Gross cross-sectional properties allowed (ACI 18.3.4)

$$
\mathrm{A}=\mathrm{bh}=(300 \mathrm{in})(8 \mathrm{in})=2,400 \mathrm{in}^{2}
$$

$\mathrm{S}=\mathrm{bh}^{2} / 6=(300 \mathrm{in})(8 \mathrm{in})^{2} / 6=3,200 \mathrm{in}^{3}$

## Set Design Parameters Allowable stresses:

Class U (ACI 18.3.3) At time of jacking (ACI 18.4.1) $\mathrm{f}^{\prime}{ }_{\mathrm{ci}}=3,000 \mathrm{psi}$
Compression $=0.60 \mathrm{f}^{\prime}{ }_{\mathrm{ci}}=0.6(3,000 \mathrm{psi})=1,800 \mathrm{psi}$
Tension $=3 \sqrt{ } \mathrm{f}_{\mathrm{ci}}=3 \sqrt{ } 3,000=164 \mathrm{psi}$
At service loads (ACI 18.4.2(a) and 18.3.3)
$\mathrm{f}_{\mathrm{c}}^{\prime}=5,000 \mathrm{psi}$
Compression $=0.45 \mathrm{f}_{\mathrm{c}}=0.45(5,000 \mathrm{psi})=2,250 \mathrm{psi}$
Tension $=6 \sqrt{ } \mathrm{f}_{\mathrm{c}}=6 \sqrt{ } 5,000=424 \mathrm{psi}$

## Average precompression limits:

$\mathrm{P} / \mathrm{A}=125 \mathrm{psi} \min .(\mathrm{ACI} 18.12 .4)$
300 psi max.

## Target load balances:

$60 \%-80 \%$ of DL (selfweight) for slabs (good approximation for hand calculation)
For this example: $0.75 \mathrm{~W}_{\mathrm{DL}}=0.75(100 \mathrm{psf})=75 \mathrm{psf}$
Cover Requirements (2-hour fire rating, assume carbonate aggregate)
IBC 2003
Restrained slabs $=3 / 4^{\prime \prime}$ bottom
Unrestrained slabs $=11 / 2^{\prime \prime}$ bottom

$$
=3 / 4^{\prime \prime} \text { top }
$$

## Tendon profile:

Parabolic shape; For a layout with spans of similar length, the tendons will be typically be located at the highest allowable point at the interior columns, the lowest possible point at the mid-spans, and the neutral axis at the anchor locations. This provides the maximum drape for load-balancing.

Figure 2: Tendon Profile

| Tendon Ordinate | Tendon (CG) Location* |
| :---: | :---: |
| Exterior support - anchor | $4.0 "$ |
| Interior support - top | $7.0 "$ |
| Interior span - bottom | $1.0 "$ |
| End span - bottom | $1.75 "$ |

$(\mathrm{CG})=$ center of gravity
*Measure from bottom of slab
$\mathrm{a}_{\mathrm{INT}}=7.0 "-1.0 "=6.0^{\prime \prime}$
$\mathrm{a}_{\mathrm{END}}=(4.0 "+7.0 ") / 2-1.75^{\prime \prime}=3.75 "$
eccentricity, $e$, is the distance from the center to tendon to the neutral axis; varies along the span

## Prestress Force Required to Balance $75 \%$ of selfweight DL

Since the spans are of similar length, the end span will typically govern the maximum required post-tensioning force. This is due to the significantly reduced tendon drape, $\mathrm{a}_{\mathrm{END}}$.

$$
\begin{aligned}
& \mathrm{W}_{\mathrm{b}}=0.75 \mathrm{~W}_{\mathrm{DL}} \\
& =0.75(100 \mathrm{psf})(25 \mathrm{ft}) \\
& =1,875 \mathrm{plf} \\
& =1.875 \mathrm{k} / \mathrm{ft}
\end{aligned}
$$

## For Exterior Span

Force needed in tendons to counteract the load in the end bay:

$$
\begin{aligned}
& \mathrm{P}=\mathrm{W}_{\mathrm{b}} \mathrm{~L}^{2} / 8 \mathrm{a}_{\text {end }} \\
& =(1.875 \mathrm{k} / \mathrm{ft})(27 \mathrm{ft})^{2} /[8(3.75 \mathrm{in} / 12)] \\
& =547 \mathrm{k}
\end{aligned}
$$

## Check Pre-Compression Allowance

Determine number of tendons to achieve 547 k

$$
\begin{aligned}
\# \text { tendons } & =(547 \mathrm{k}) /(26.6 \mathrm{k} / \text { tendon }) \\
& =20.56
\end{aligned}
$$

Use 20 tendons
Actual force for banded tendons

$$
P_{\text {actual }}=(20 \text { tendons })(26.6 \mathrm{k})=532 \mathrm{k}
$$

The balanced load for the end span is slightly adjusted $\mathrm{w}_{\mathrm{b}}=(532 / 547)(1.875 \mathrm{k} / \mathrm{ft})=1.82 \mathrm{k} / \mathrm{ft}$

Determine actual Precompression stress

$$
\begin{aligned}
\mathrm{P}_{\text {actual }} / \mathrm{A} & =(532 \mathrm{k})(1000) /\left(2,400 \mathrm{in}^{2}\right) \\
& =221 \mathrm{psi}>125 \text { psi min. ok } \\
& <300 \text { psi max. ok }
\end{aligned}
$$

## Check Interior Span Force

$$
\begin{aligned}
\mathrm{P} & =(1.875 \mathrm{k} / \mathrm{ft})(30 \mathrm{ft}) 2 /[8(6.0 \mathrm{in} / 12)] \\
& =421 \mathrm{k}<532 \mathrm{k} \text { Less force is required in the center bay }
\end{aligned}
$$

For this example, continue the force required for the end spans into the interior span and check the amount of load that will be balanced:

$$
\begin{aligned}
\mathrm{w}_{\mathrm{b}} & =(532 \mathrm{k})(8)(6.0 \mathrm{in} / 12) /(30 \mathrm{ft})^{2} \\
& =2.36 \mathrm{k} / \mathrm{ft} \mathrm{wb} / \mathrm{wDL}=94 \% ;\left[\mathrm{W}_{\mathrm{DL}}=100 * 25=2.5 \mathrm{ksf}\right]
\end{aligned}
$$

This value is less than $100 \%$; acceptable for this design.

## East-West interior frame:

Effective prestress force, $\mathrm{P}_{\text {eff }}=532$ kips

## Check Slab Stresses

Separately calculate the maximum positive and negative moments in the frame for the dead, live, and balancing loads. A combination of these values will determine the slab stresses at the time of stressing and at service loads.

## Dead Load Moments

$$
w_{\mathrm{DL}}=(125 \mathrm{psf})(25 \mathrm{ft}) / 1000=3.125 \mathrm{plf}
$$

Live Load Moments

Total Balancing Moments, $M_{\text {bal }}$
$w_{\mathrm{b}}=-2.00 \mathrm{k} / \mathrm{ft}$ (average of 3 bays)

Figure 3: Moment Diagram for DL, LL and Balancing Load

## Stage 1: Stresses immediatelv after iacking (DL + PT) (ACI 18.4.1)

## Midspan Stresses

$$
\begin{aligned}
& \mathrm{f}_{\mathrm{top}}=\left(-\mathrm{M}_{\mathrm{DL}}+\mathrm{M}_{\mathrm{b}}\right) / \mathrm{S}-\mathrm{P} / \mathrm{A} \\
& \mathrm{f}_{\mathrm{bot}}=\left(+\mathrm{M}_{\mathrm{DL}}-\mathrm{M}_{\mathrm{b}}\right) / \mathrm{S}-\mathrm{P} / \mathrm{A}
\end{aligned}
$$

## Interior Span

$$
\begin{aligned}
\mathrm{f}_{\text {top }} & =[(-101 \mathrm{ft}-\mathrm{k}+65 \mathrm{ft}-\mathrm{k})(12)(1000)] /\left(3200 \mathrm{in}^{3}\right)-221 \mathrm{psi} \\
& =-135-221=-356 \mathrm{psi} \text { compression }<0.60 \mathrm{f}^{\prime}{ }_{\mathrm{ci}}=1800 \mathrm{psi} \text { ok } \\
\mathrm{f}_{\text {bot }} & =[(101 \mathrm{ft}-\mathrm{k}-65 \mathrm{ft}-\mathrm{k})(12)(1000)] /\left(3200 \mathrm{in}^{3}\right)-221 \mathrm{psi} \\

\end{aligned}
$$

All stresses are within the permissible code limits.

## Ultimate Strength

Determine factored moments
The primary post-tensioning moments, $\mathrm{M}_{1}$, vary along the length of the span.

$$
\mathrm{M}_{1}=\mathrm{P} * \mathrm{e}
$$

$\mathrm{e}=0$ in. at the exterior support
$\mathrm{e}=3.0$ in at the interior support (neutral axis to the center of tendon)
$\mathrm{M}_{1}=(532 \mathrm{k})(3.0 \mathrm{in}) /(12)=133 \mathrm{ft}-\mathrm{k}$

Figure 4: Secondary Moment Diagram
The secondary post-tensioning moments, $\mathrm{M}_{\mathrm{sec}}$, vary linearly between supports.

$$
\mathrm{M}_{\mathrm{sec}}=\mathrm{M}_{\mathrm{b}}-\mathrm{M}_{1}=154 \mathrm{ft}-\mathrm{k}-133 \mathrm{ft}-\mathrm{k}
$$

$=21 \mathrm{ft}-\mathrm{k}$ at the interior supports
The typical load combination for ultimate strength design is

$$
\mathrm{M}_{\mathrm{u}}=1.2 \mathrm{M}_{\mathrm{DL}}+1.6 \mathrm{M}_{\mathrm{LL}}+1.0 \mathrm{M}_{\mathrm{sec}}
$$

## At midspan:

$$
\mathrm{M}_{\mathrm{u}}=1.2(172 \mathrm{ft}-\mathrm{k})+1.6(45 \mathrm{ft}-\mathrm{k})+1.0(10.5 \mathrm{ft}-\mathrm{k})=289 \mathrm{ft}-\mathrm{k}
$$

At support:

$$
\mathrm{M}_{\mathrm{u}}=1.2(-240 \mathrm{ft}-\mathrm{k})+1.6(-64 \mathrm{ft}-\mathrm{k})+1.0(21 \mathrm{ft}-\mathrm{k})=-370 \mathrm{ft}-\mathrm{k}
$$

## Determine minimum bonded reinforcement:

To see if acceptable for ultimate strength design.

## Positive moment region:

Interior span: $\mathrm{f}_{\mathrm{t}}=15 \mathrm{psi}<2 \sqrt{ } \mathrm{f}^{\prime} \mathrm{c}=2 \sqrt{ } 5,000=141 \mathrm{psi}$
No positive reinforcement required (ACI 18.9.3.1)
Exterior span: $\mathrm{f}_{\mathrm{t}}=180 \mathrm{psi}>2 \sqrt{ } \mathrm{f}^{\mathrm{c}} \mathrm{c}=2 \sqrt{5}, 000=141 \mathrm{psi}$
Minimum positive moment reinforcement required
(ACI 18.9.3.2) / (BNBC 2020-Section 9.9.4)

$$
\begin{aligned}
\mathrm{y} & =\mathrm{f}_{\mathrm{t}} /\left(\mathrm{f}_{\mathrm{t}}+\mathrm{f}_{\mathrm{c}}\right) \mathrm{h} \\
& =[(180) /(180+622)](8 \mathrm{in}) \\
& =1.80 \mathrm{in} \\
\mathrm{~N}_{\mathrm{c}} & =\mathrm{M}_{\mathrm{DL}+\mathrm{LL}} / \mathrm{S} * 0.5 * \mathrm{y} * 12 \\
& =\left[(172 \mathrm{ft}-\mathrm{k}+45 \mathrm{ft}-\mathrm{k})(12) /\left(3,200 \mathrm{in}^{3}\right)\right](0.5)(1.80 \mathrm{in})(25 \mathrm{ft})(12)=220 \mathrm{k}
\end{aligned}
$$

$$
\mathrm{A}_{\mathrm{s}, \min }=\mathrm{N}_{\mathrm{c}} / 0.5 \mathrm{fy}=(220 \mathrm{k}) /[0.5(60 \mathrm{ksi})]=7.33 \mathrm{in}^{2}
$$

Distribute the positive moment reinforcement uniformly across the slab-beam width and as close as practicable to the extreme tension fiber.
$\mathrm{A}_{\mathrm{s}, \min }=(7.33 \mathrm{in} 2) /(25 \mathrm{ft})=0.293 \mathrm{in}^{2} / \mathrm{ft}$
Use \#5 @ 12 in . oc Bottom $=0.31 \mathrm{in}^{2} / \mathrm{ft}$ (or equivalent)
Minimum length shall be $1 / 3$ clear span and centered in positive moment region (ACI 18.9.4.1)

## Negative moment region:

$$
\mathrm{A}_{\mathrm{s}, \min }=0.00075 \mathrm{~A}_{\mathrm{cf}}(\mathrm{ACI} 18.9 .3 .3)
$$

## Interior supports:

$$
\begin{aligned}
& \mathrm{A}_{\mathrm{cf}}=\max .(8 \mathrm{in})[(30 \mathrm{ft}+27 \mathrm{ft}) / 2,25 \mathrm{ft}] * 12 \\
& \mathrm{As}, \min =0.00075(2,736 \mathrm{in} 2)=2.05 \mathrm{in}^{2}=11-\# 4 \mathrm{Top}\left(2.20 \mathrm{in}^{2}\right)
\end{aligned}
$$

## Exterior supports:

$$
\begin{aligned}
& \mathrm{A}_{\mathrm{cf}}=\max .(8 \mathrm{in})[(27 \mathrm{ft} / 2), 25 \mathrm{ft}] * 12 \\
& \mathrm{~A}_{\mathrm{s}, \min }=0.00075\left(2,400 \mathrm{in}^{2}\right)=1.80 \mathrm{in}^{2} \\
&=9-\# 4 \mathrm{Top}(1.80 \mathrm{in} 2)
\end{aligned}
$$

Must span a minimum of $1 / 6$ the clear span on each side of support (ACI 18.9.4.2)
At least 4 bars required in each direction (ACI 18.9.3.3)
Place top bars within 1.5 h away from the face of the support on each side (ACI 18.9.3.3)

$$
=1.5(8 \mathrm{in})=12 \mathrm{in}
$$

Maximum bar spacing is 12 " (ACI 18.9.3.3)
Check minimum reinforcement if it is sufficient for ultimate strength

$$
\begin{aligned}
& \mathrm{M}_{\mathrm{n}}=\left(\mathrm{A}_{\mathrm{s}} \mathrm{f}_{\mathrm{y}}+\mathrm{A}_{\mathrm{ps}} \mathrm{f}_{\mathrm{ps}}\right)(\mathrm{d}-\mathrm{a} / 2) \\
& \mathrm{d}=\text { effective depth } \\
& \mathrm{A}_{\mathrm{ps}}=0.153 \mathrm{in}^{2} *(\text { number of tendons })=0.153 \mathrm{in}^{2 *}(20 \text { tendons })=3.06 \text { in }^{2} \\
& \mathrm{f}_{\mathrm{ps}}=\mathrm{f}_{\mathrm{se}}+10,000+\left(\mathrm{f}_{\mathrm{c}} \mathrm{cbd}\right) /\left(300 \mathrm{~A}_{\mathrm{ps}}\right) \text { for slabs with } \mathrm{L} / \mathrm{h}>35(\mathrm{ACI} 18.7 .2) \\
&=174,000 \mathrm{psi}+10,000+[(5,000 \mathrm{psi})(25 \mathrm{ft} * 12) \mathrm{d}] /\left[(300)\left(3.06 \mathrm{in}^{2}\right)\right] \\
&=184,000 \mathrm{psi}+1634 \mathrm{~d} \\
& \mathrm{a}=\left(\mathrm{A}_{\mathrm{s}} \mathrm{f}_{\mathrm{y}}+\mathrm{A}_{\mathrm{ps}} \mathrm{f}_{\mathrm{ps}}\right) /\left(0.85 \mathrm{f}^{\prime} \mathrm{cb}\right)
\end{aligned}
$$

At supports $d=8^{\prime \prime}-3 / 4^{\prime \prime}-1 / 4^{\prime \prime}=7^{\prime \prime}$

$$
\begin{aligned}
\mathrm{f}_{\mathrm{ps}} & =184,000 \mathrm{psi}+1634(7>)=195,438 \mathrm{psi} \\
\mathrm{a} & =\left[\left(2.20 \mathrm{in}^{2}\right)(60 \mathrm{ksi})+\left(3.06 \mathrm{in}^{2}\right)(195 \mathrm{ksi})\right] /\left[(0.85)(5 \mathrm{ksi})\left(25 \mathrm{ft}^{*} 12\right)\right]=0.57 \\
\phi \mathrm{Mn} & =0.9\left[\left(2.20 \mathrm{in}^{2}\right)(60 \mathrm{ksi})+\left(3.06 \mathrm{in}^{2}\right)(195 \mathrm{ksi})\right][7 "-(0.57) / 2] / 12 \\
& =0.9(728 \mathrm{k})(6.72 \mathrm{in}) / 12=367 \mathrm{ft}-\mathrm{k}<370 \mathrm{ft}-\mathrm{k}
\end{aligned}
$$

Reinforcement for ultimate strength requirements governs as, reqd $=2.30 \mathrm{in}^{2}$

> 12 - \#4 Top at interior supports
> 9 - \#4 Top at exterior supports

When reinforcement is provided to meet ultimate strength requirements, the minimum lengths must also conform to the provision of ACI 318-05 Chapter 12. (ACI 18.9.4.3)

```
At midspan (end span)
\(d=8 "-11 / 2 "-1 / 4 "=61 / 4 "\)
\(\mathrm{fps}=184,000 \mathrm{psi}+1634\left(6.25^{\prime \prime}\right)\)
    \(=194,212 \mathrm{psi}\)
\(\mathrm{a}=\left[(7.33 \mathrm{in} 2)(60 \mathrm{ksi})+\left(3.06 \mathrm{in}^{2}\right)(194 \mathrm{ksi})\right] /[(0.85)(5 \mathrm{ksi})(25 \mathrm{ft} * 12)]=0.81\)
\(\phi \mathrm{Mn}=0.9\left[\left(7.33 \mathrm{in}^{2}\right)(60 \mathrm{ksi})+\left(3.06 \mathrm{in}^{2}\right)(194 \mathrm{ksi})\right][6.25 "-(0.81) / 2] / 12\)
    \(=0.9(1033 \mathrm{k})(5.85 \mathrm{in}) / 12=453 \mathrm{ft}-\mathrm{k}>289 \mathrm{ft}-\mathrm{k}\)
```

Minimum reinforcement ok

```
#5 @ 12"c/c Bottom at end spans
```

This is a simplified hand calculation for a post-tensioned two-way plate design. A detailed example can be found in the PCA Notes on ACI 318-05 Building Code Requirements for Structural Concrete. A simplified detailing of prestressed slab given below.

Figure- Detailing of Two way Post Tensioned Slab (E-W Direction)

## 4.Circular prestressing

## General

Circular Prestressing" is employed to denote the prestressing of circular structures such as pipes and tanks where the prestressing wires are wound in circles. In contrast to this term, "linear prestressing" is used to include all other types of prestressing, where the cables may be either straight or curved, but not wound in circles around a circular structure. In most prestressed circular structures, prestress is applied both circumferentially and longitudinally, the circumferential prestress being circular and the longitudinal prestress actually linear.
The circumferential prestressing resists the hoop tension generated due to the internal pressure. The prestressing is done by wires or tendons placed spirally, or over sectors of the circumference of the member. The wires or tendons lay outside the concrete core. Hence, the centre of the prestressing steel (CGS) is outside the core concrete section. When the prestressed members are curved, in the direction of prestressing, the prestressing is called circular prestressing. For example, circumferential prestressing in pipes, tanks, silos, containment structures and similar structures is a type of circular prestressing. In these structures, there can be prestressing in the longitudinal direction (parallel to axis) as well. Circular prestressing is also applied in domes and shells. [https://theconstructor.org]

## Introduction

When the prestressed members are curved, in the direction of prestressing, the prestressing is called circular prestressing. For example, circumferential prestressing in pipes, tanks, silos, containment structures and similar structures is a type of circular prestressing. In these structures, there can be prestressing in the longitudinal direction (parallel to axis) as well. Circular prestressing is also applied in domes and shells. The circumferential prestressing resists the hoop tension generated due to the internal pressure. The prestressing is done by wires or tendons placed spirally, or over sectors of the circumference of the member. The wires or tendons lay outside the concrete core. Hence, the centre of the prestressing steel (CGS) is outside the core concrete section. The hoop compression generated is considered to be uniform across the thickness of a thin shell. Hence, the pressure line (or C-line) lies at the centre of the core concrete section (CGC). The following sketch shows the internal forces under service conditions. The analysis is done for a slice of unit length along the longitudinal direction (parallel to axis).

Liquid retaining structures, such as circular pipes, tanks and pressure vessels are admirably suited for circular prestressing. The circumferential hoop compression induced in concrete by prestressing counterbalances the hoop tension developed due to the internal fluid pressure. A reinforced concrete pressure pipe requires a large amount of reinforcement to ensure low-tensile stresses resulting in a crack-free structure. However, circular prestressing eliminates cracks and provides for an economical use of materials. In addition, prestressing safeguards against shrinkage cracks in liquid retaining structures. [https://www.scribd.com/document]

(a) Due to prestress

(b) Due to internal pressure

Fig1: Internal forces under service conditions
[https://www.scribd.com/document]
To reduce the loss of prestress due to friction, the prestressing can be done over sectors of the circumference. Buttresses are usedfor the anchorage of the tendons. The following sketch shows the buttresses along the circumference.

Fig 2: Use of buttress in Circular prestressing
[https://www.scribd.com/document]

## Design parameters

## General analysis

## a) Analysis at transfer

The compressive stress can be calculated from the compression C. From equilibrium, $\mathrm{C}=\mathrm{Po}$, where $\mathrm{P}_{\mathrm{o}}$ is the prestress at transfer after short-term losses. The compressive stress $\left(f_{c}\right)$ i s giv e $n$ as $f_{c}=-P_{o} / A$,
Where,
$\mathrm{A}=$ area of the longitudinal section of the slice. The permissible prestress is determined based on $\mathrm{f}_{\mathrm{c}}$ within the allowable stress at transfer ( $\mathrm{f}_{\mathrm{cc}} /$ all $)$.

## b) Analysis at service loads

The tensile stress due to the internal pressure (p) can be calculated from the tension $T$. From equilibrium of half of the slice, $T=\rho R$. Where, $R$ is the radius of the midsurface of the cylinder. The resultant stress ( $\mathrm{f}_{\mathrm{c}}$ ) due to the effective prestress $\left(\mathrm{P}_{\mathrm{e}}\right)$ and internal pressure is given as, $f_{c}=-P_{o} / A+\rho R / A_{t}$
$\mathrm{A}_{\mathrm{t}}=$ area of the transformed longitudinal section of the slice.

## Design

The internal pressure $\rho$ and the radius are given variables. It is assumed that the prestressing steel alone carries the hoop tension due to internal pressure, that is, $\mathrm{P}_{\mathrm{e}}=\mathrm{A}_{\mathrm{p}} \mathrm{f}_{\mathrm{ps}}=\rho \mathrm{R}$.
The steps of design are as follows:

1) Calculate the area of the prestressing steel from the equation, $A_{p}=\rho R / f_{p e}$
2) Calculate the prestress at transfer from an estimate of the permissible initial stress $f_{p o}$ and using the equation $P_{o}=A_{p} f_{p o}$.
3) Calculate the thickness of the concrete shell from the equation, $A=P o / f_{c c}$, here $f_{c c, a l l}$ is the allowable compressive stress at transfer.
4) Calculate the resultant stress $f_{c}$ at the service condition. The value of $f_{c}$ should be within $\mathrm{f}_{\mathrm{cc} \text {,all }}$ the allowable compressive stress at service conditions.
